2nd AIAA CFD Drag Prediction Workshop

Data Summary and Comparison

Kelly Laflin

Overview

- Participant Summary
- Grid Convergence Study: Case 1
- Drag Polar: Case 2
- Tripped vs. Fully Turbulent: Case 3
- Drag Rise: Case 4
- Conclusions

Participant Summary

- 22 participants + many others (1st DPW: 18)

US 50%

Gov't 31%

Europe 29%

Industry 46%

Asia 21%

Academia 21%

- 20 codes, 30 data submittals

Grid Types

14 1-to-1 structured

11 Unstructured

5 Overset

Turbulence Models

16 Spalart-Allmaras

5 Menter's SST

3 k- ϵ

2 k-Wilcox, k- ϵ , other

Participant Summary (cont.)

30 data submittals

- 16 complete sets for Case 1
- 30 *partial* data sets for Case 2
- 7 data sets for Case 3
- 3 data sets for Case 4

~ 480 Total Solutions Computed!

~ 1.25 years of CPU time!!!

Single Point Grid Convergence Study

Mach = 0.75, Re = 3×10^6 , $C_L = 0.500 \pm .001$

Why did Richardson Extrapolation Fail?

Case 1

June 21-22, 2003

2nd AIAA CFD Drag Prediction Workshop

Orlando, FL 17

Why did Richardson Extrapolation Fail?

- Asymptotic Range not met – grids too sparse

Case 1

Why did Richardson Extrapolation Fail?

- Asymptotic Range not met – grids too sparse
- Drag not converged

Case 1

Why did Richardson Extrapolation Fail?

- Asymptotic Range not met – grids too sparse
- Drag not converged
- C_L tolerance not met

Case 1

Why did Richardson Extrapolation Fail?

- Asymptotic Range not met – grids too sparse
- Drag not converged
- C_L tolerance not met
- Low precision report of drag

Case 1

Why did Richardson Extrapolation Fail?

- Asymptotic Range not met – grids too sparse
- Drag not converged
- C_L tolerance not met
- Low precision report of drag
- Participant reporting errors

Case 1

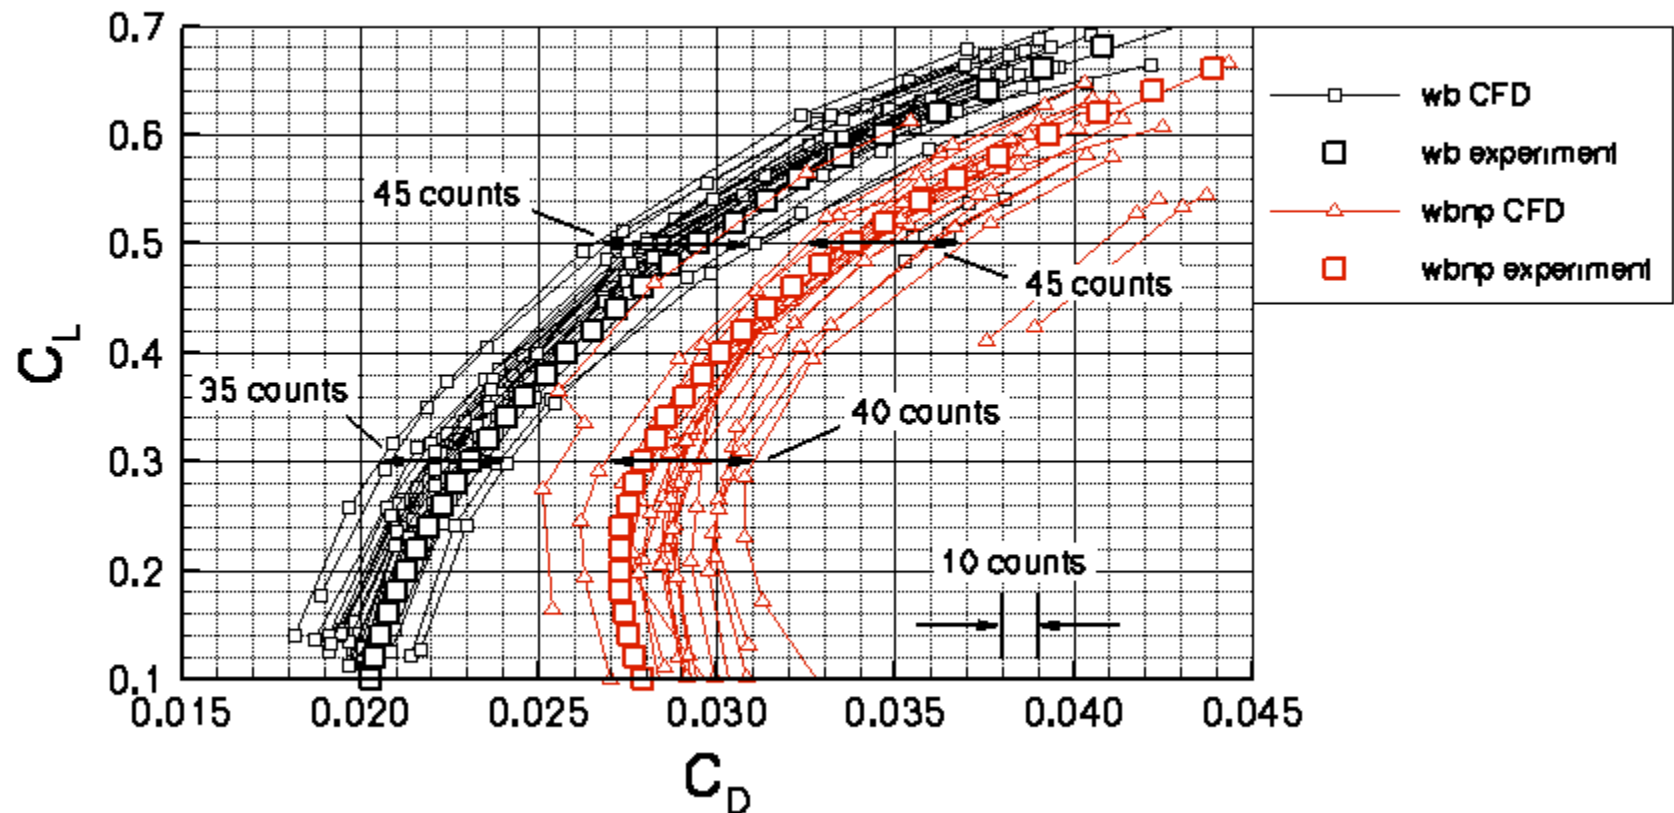

Extrapolated Delta Drag Revisited

Case 1

Drag Polar

Mach = 0.75, Re = 3×10^6

Case 2

Grid Type

Idealized Profile Drag

Case 2

Turbulence Models

Idealized Profile Drag

Case 2

Tripped vs. Fully Turbulent

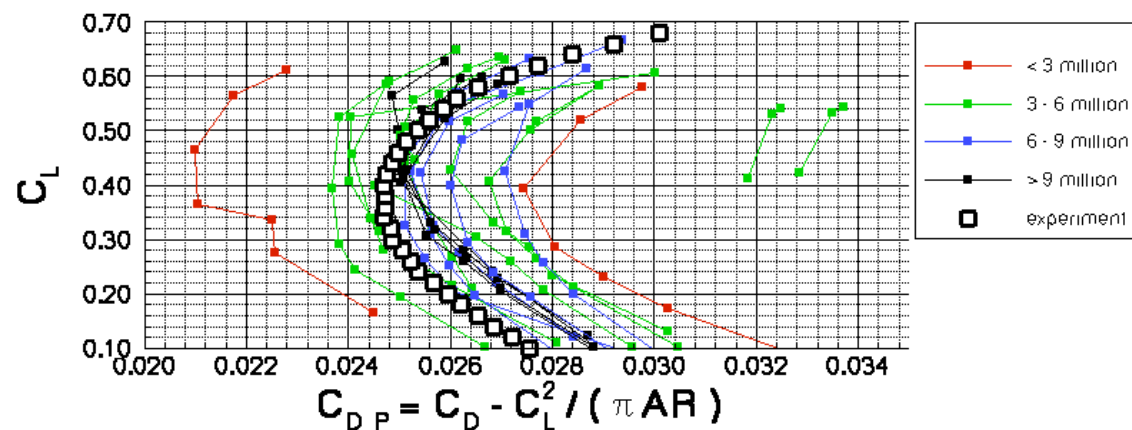

Idealized Profile Drag

Case 2

Grid Size

Idealized Profile Drag

Case 2

Induced Drag

Conclusions

Conclusions

- Comparison with experiment pretty good, despite separation.

Conclusions

- Comparison with experiment pretty good, despite separation.
- Data scatter “perceived” to be less than DPW 1.

Conclusions

- Comparison with experiment pretty good, despite separation.
- Data scatter “perceived” to be less than DPW 1.
- Data averages indicate medium grid sizes are adequate.

Conclusions

- Comparison with experiment pretty good, despite separation.
- Data scatter “perceived” to be less than DPW 1.
- Data averages indicate medium grid sizes are adequate.
- Richardson Extrapolation highlights some concerns.

Conclusions

- Comparison with experiment pretty good, despite separation.
- Data scatter “perceived” to be less than DPW 1.
- Data averages indicate medium grid sizes are adequate.
- Richardson Extrapolation highlights some concerns.
- Fully turbulent calcs. okay for delta drag calculations.

Conclusions

- Comparison with experiment pretty good, despite separation.
- Data scatter “perceived” to be less than DPW 1.
- Data averages indicate medium grid sizes are adequate.
- Richardson Extrapolation highlights some concerns.
- Fully turbulent calcs. okay for delta drag calculations.
- Grid resolution! Grid resolution! Grid resolution!

Conclusions

- Comparison with experiment pretty good, despite separation.
- Data scatter “perceived” to be less than DPW 1.
- Data averages indicate medium grid sizes are adequate.
- Richardson Extrapolation highlights some concerns.
- Fully turbulent calcs. okay for delta drag calculations.
- Grid resolution! Grid resolution! Grid resolution!
- More comprehensive summary at Reno 2004.

Requests

- Participants:
 - Complete/correct/recheck data and resubmit.
 - Report results to greater precision.
 - Indicate if code is node-based or cell-based.
 - Indicate if grid is supplied by DPW or otherwise.
- Need standard for reporting non- or slow-converging solutions. *Time ave. values, with max. delta reported?*
